

## Deciding Which Format to Use

With so many available formats for saving and sharing your work, how do you decide which to use?

This is based, in part, on whether you can share your data, and whether you want others to access the data in JMP.

Remember that you also need to consider who your audience is and what you want them to know (or do) with the results.

Of the methods you have been introduced to in this lesson, the most popular and perhaps easiest to use, are saving scripts to data tables, saving static output, saving journals, and publishing reports to JMP Public.

In the next JMP demonstration videos, you learn more about how to use JSL scripts to save your work to make your analyses repeatable. You also learn how to save static output, how to copy and paste static output into another application, and how to create and share JMP journals.

These videos cover the basic steps for saving your work in these formats. For additional details and examples, and for information about publishing reports to JMP Public or saving results in other formats, see the Read About It for this module or search for "Save and Share" in the JMP Help.
